Vectors and Scalars

Scalar Quantities

- Have only magnitude
- Examples: mass, temperature, time

Vector Quantities

- Have magnitude and direction
- Examples: displacement, velocity, acceleration

Table of Contents

- 1 Introduction
- 2 Vectors and Scalars

- 6 Worked Examples
- 7 Conclusion

Graphical Methods

Head-to-Tail Method

- 1 Draw the first vector
- 2 Draw the second vector from the head of the first
- 3 Resultant vector: from tail of first to head of second

Parallelogram Method

- 1 Draw both vectors from a common point
- 2 Complete the parallelogram
- 3 Resultant vector: diagonal of the parallelogram

Vector Components

Components of a vector \vec{A} :

$$A_x = A \cos \theta$$

$$A_y = A \sin \theta$$

Where:

- A is the magnitude of the vector
- θ is the angle with the positive x-axis

Figure: Vector Components

Adding Vectors Analytically

- 1 Resolve vectors into x and y components

Adding Vectors Analytically

- 1 Resolve vectors into x and y components
- 2 Sum x-components: $R_x = \sum A_x$

Adding Vectors Analytically

- 1 Resolve vectors into x and y components
- 2 Sum x-components: $R_x = \sum A_x$
- 3 Sum y-components: $R_y = \sum A_y$

Adding Vectors Analytically

- 1 Resolve vectors into x and y components
- 2 Sum x-components: $R_x = \sum A_x$
- 3 Sum y-components: $R_y = \sum A_y$
- 4 Find magnitude: $R = \sqrt{R_x^2 + R_y^2}$

Adding Vectors Analytically

- 1 Resolve vectors into x and y components
- 2 Sum x-components: $R_x = \sum A_x$
- 3 Sum y-components: $R_y = \sum A_y$
- 4 Find magnitude: $R = \sqrt{R_x^2 + R_y^2}$
- 5 Find direction: $\theta_R = \tan^{-1} \left(\frac{R_y}{R_x} \right)$

- 6 Worked Examples
- 7 Conclusion

Projectile Motion

Assumptions

- Air resistance is negligible
- Acceleration due to gravity (g) is constant
- Horizontal motion is at constant velocity

Key Concepts

- Two-dimensional motion
- Vertical motion: accelerated
- Horizontal motion: constant velocity

Equations of Motion

Horizontal motion:

$$x = v_{0x}t$$

$$v_x = v_{0x}$$

Where:

- $v_{0x} = v_0 \cos \theta$
- $v_{0y} = v_0 \sin \theta$

Vertical motion:

$$y = v_{0y}t - \frac{1}{2}gt^2$$

$$v_y = v_{0y} - gt$$

Range of a Projectile

For a projectile launched and landing at the same vertical level:

$$R = \frac{v_0^2 \sin 2\theta}{g}$$

Where:

- R is the range
- v_0 is the initial velocity
- θ is the launch angle
- g is the acceleration due to gravity

Table of Contents

- 1 Introduction
- 2 Vectors and Scalars
- 3 Vector Addition and Subtraction: Graphical Methods
- 4 Vector Addition and Subtraction: Analytical Methods
- 5 Projectile Motion
- 6 Worked Examples**
- 7 Conclusion

Example 1: Vector Addition

Problem: Walk 18.0 m west, then 25.0 m north. Find distance and direction from start.

Solution steps:

- 1 Resolve vectors into components
- 2 Sum components
- 3 Find magnitude of resultant
- 4 Find direction

Figure: Vector Addition

Example 1: Solution

$$R_x = -18.0 \text{ m}$$

$$R_y = 25.0 \text{ m}$$

$$R = \sqrt{(-18.0 \text{ m})^2 + (25.0 \text{ m})^2} = 30.8 \text{ m}$$

$$\theta = \tan^{-1} \left(\frac{25.0}{-18.0} \right) = -54.25^\circ$$

Answer: 30.8 m at 35.8° west of north

Example 2: Vector Components in Rotated Axes

Problem: You fly 32.0 km in a straight line in still air in the direction 35.0° south of west.

(a) Find the distances you would have to fly straight south and then straight west to arrive at the same point.

$$D_W = 32.0 \cos 35^\circ = 26.2 \text{ km}$$

$$D_S = 32.0 \sin 35^\circ = 18.4 \text{ km}$$

Example 2: Solution (continued)

(b) Find the distances you would have to fly first in a direction 45.0° south of west and then in a direction 45.0° west of north.

These are the components of the displacement along a different set of axes—one rotated 45° .

$$\theta' = 35^\circ - 45^\circ = -10^\circ$$

$$D_{SW} = 32.0 \cos 10^\circ = 31.5 \text{ km}$$

$$D_{NW} = 32.0 \sin 10^\circ = 5.56 \text{ km}$$

Figure: Rotated Axes

Example 3: Vector Addition Verification

Problem: Verify sum of vectors \vec{A} (27.5 m at 66° North of East) and \vec{B} (30.0 m at 112° North of East)

Steps:

- 1 Resolve vectors into components
- 2 Sum components
- 3 Find magnitude and direction of resultant

Figure: Vector Addition

Example 3: Solution

Trigonometry is left as an exercise.

$$R_x = 11.19 \text{ m} + (-11.25 \text{ m}) = -0.06 \text{ m}$$

$$R_y = 25.28 \text{ m} + 28.00 \text{ m} = 53.28 \text{ m}$$

$$R = \sqrt{(-0.06 \text{ m})^2 + (53.28 \text{ m})^2} = 53.28 \text{ m}$$

$$\theta_R = \tan^{-1} \left(\frac{53.28}{-0.06} \right) \approx -89.9^\circ$$

Result: 53.28 m almost due north, slightly west

Long Jump World Record Analysis

Problem: The world long jump record is 8.95 m (Mike Powell, USA, 1991). Treated as a projectile, what is the maximum range obtainable by a person with a take-off speed of 9.5 m/s?

Assumptions:

- Scenario 1: Motion is on level ground (take-off and landing at same height)
- Scenario 2: Person's center of mass is 1.0 m above the ground at take-off
- Optimal angle is 45°
- Air resistance is negligible

Scenario 1: Level Ground

Using the range formula:

$$R = \frac{v_0^2 \sin 2\theta}{g} = \frac{(9.5 \text{ m/s})^2 \sin 90^\circ}{9.8 \text{ m/s}^2} = 9.21 \text{ m}$$

Scenario 2: 1.0 m Height Difference

- ① Find time of flight:

$$y = -1.0 \text{ m} = (9.5 \text{ m/s})(\sin 45^\circ)t - \frac{1}{2}(9.80 \text{ m/s}^2)t^2$$

Solving: $t = 1.51 \text{ s}$

- ② Calculate range:

$$R = v_0(\cos 45^\circ)t = (9.5 \text{ m/s})(\cos 45^\circ)(1.51 \text{ s}) = 10.44 \text{ m}$$

Conclusion

Maximum obtainable range:

- Scenario 1 (level ground): 9.21 m
- Scenario 2 (1.0 m height difference): 10.44 m

Both scenarios exceed the world record of 8.95 m, likely due to idealized assumptions.

Table of Contents

- 1 Introduction
- 2 Vectors and Scalars
- 3 Vector Addition and Subtraction: Graphical Methods
- 4 Vector Addition and Subtraction: Analytical Methods
- 5 Projectile Motion
- 6 Worked Examples
- 7 Conclusion**

Conclusion

- Vectors are essential for describing motion in two dimensions

Conclusion

- Vectors are essential for describing motion in two dimensions
- Both graphical and analytical methods are important

Conclusion

- Vectors are essential for describing motion in two dimensions
- Both graphical and analytical methods are important
- Projectile motion combines horizontal and vertical components

Conclusion

- Vectors are essential for describing motion in two dimensions
- Both graphical and analytical methods are important
- Projectile motion combines horizontal and vertical components
- Practice problem-solving to master these concepts
