### PHYS11 CH: 22-23

### Magnetism and Electromagnetic Induction

Mr. Gullo

PHYS11 - College Physics

April 10, 2025

### Outline

- 1 Introduction to Magnetism
- 2 Magnetic Forces
- Magnetic Fields from Currents
- 4 Electromagnetic Induction
- 6 Applications
- 6 Inductance and AC Circuits
- Example Problems
- 8 Summary

## Learning Objectives

### By the end of this presentation, you will be able to:

- Describe the properties of magnets and magnetic fields
- Apply the right hand rules to determine directions of magnetic forces and fields
- Calculate magnetic forces on moving charges and current-carrying conductors
- Explain electromagnetic induction and apply Faraday's law
- Understand the operation of generators, motors, and transformers
- Calculate inductance and analyze RL and RLC circuits

# Magnets and Magnetic Fields

- Magnets have north and south poles
- North pole: attracted to Earth's geographic north
- Like poles repel, unlike poles attract
- Poles always occur in pairs (no magnetic monopoles)
- All magnetism is created by electric current

[Image of bar magnets showing attraction between opposite poles and repulsion between like poles]

# Magnetic Field Lines

### Properties of Magnetic Field Lines

- Field is tangent to the magnetic field line
- Field strength is proportional to line density
- Field lines cannot cross
- Field lines are continuous loops

[Diagram showing magnetic field lines around a bar magnet]

# Ferromagnets and Electromagnets

### Ferromagnetic Materials:

- Iron, cobalt, nickel, gadolinium
- Atoms act like small magnets
- Form domains where magnetic moments align
- Curie temperature: above this temperature, ferromagnetism disappears

### **Electromagnets:**

- Current through a wire creates magnetic field
- Adding ferromagnetic core increases field strength
- Applications: motors, generators, MRI machines

[Image showing magnetic domains in a ferromagnetic material]

# Force on a Moving Charge

### Magnetic Force Formula

$$\vec{F} = q\vec{v} \times \vec{B}$$
 or  $F = qvB\sin\theta$  (1)

- q = charge (C)
- v = velocity (m/s)
- B = magnetic field strength (T)
- $m{\bullet}$   $\theta = \text{angle between } \vec{v} \text{ and } \vec{B}$
- Direction determined by Right Hand Rule 1 (RHR-1)

[Illustration of Right Hand Rule 1]

# Right Hand Rule 1 (RHR-1)

### RHR-1 for Force on a Moving Charge

Point the thumb of your right hand in the direction of the velocity  $\vec{v}$ , fingers in the direction of the magnetic field  $\vec{B}$ , and the force  $\vec{F}$  is perpendicular to the palm.

- For negative charges, force is in opposite direction
- ullet Force is always perpendicular to both  $ec{v}$  and  $ec{B}$
- When  $\vec{v}$  and  $\vec{B}$  are parallel,  $\vec{F} = 0$

# Motion of Charged Particles in Magnetic Fields

- When velocity perpendicular to field, particles move in circular path
- Radius of circular path:  $r = \frac{mv}{qB}$
- Magnetic force provides centripetal force
- Period of revolution independent of speed
- Helical path when velocity has component parallel to field

[Diagram showing circular motion of charged particle in magnetic field]

# Force on Current-Carrying Conductors

### Magnetic Force on a Current-Carrying Conductor

$$\vec{F} = I\vec{I} \times \vec{B}$$
 or  $F = IIB \sin \theta$  (2)

- I = current (A)
- I = length of conductor (m)
- B = magnetic field strength (T)
- $\theta = \text{angle between } \vec{l} \text{ and } \vec{B}$
- Direction follows RHR-1 with thumb in direction of current

[Diagram showing force on a current-carrying wire in a magnetic field]

## Torque on Current Loops

#### Torque on a Current Loop

$$\tau = NIAB \sin \theta \tag{3}$$

- N = number of turns
- I = current (A)
- $A = \text{area of loop } (m^2)$
- B = magnetic field strength (T)
- $oldsymbol{ heta} heta = ext{angle between loop normal and } ec{B}$

**Applications:** Electric motors, meters [Diagram of a current loop in a magnetic field showing torque]

# Magnetic Fields Produced by Currents

## Magnetic Field from a Long Straight Wire

$$B = \frac{\mu_0 I}{2\pi r} \tag{4}$$

- $\mu_0 = 4\pi \times 10^{-7} \text{ T·m/A}$  (permeability of free space)
- I = current (A)
- r = distance from wire (m)
- Direction determined by Right Hand Rule 2 (RHR-2)

[Diagram showing magnetic field lines around a current-carrying wire]

# Right Hand Rule 2 (RHR-2)

### RHR-2 for Magnetic Field from Current

Point the thumb of your right hand in the direction of the current, and your fingers curl in the direction of the magnetic field lines.

- Field lines form concentric circles around a straight wire
- Field strength decreases with distance from wire
- Total field from any current path is the vector sum of fields from all segments

# Magnetic Fields from Loops and Solenoids

#### Circular Loop:

$$B = \frac{\mu_0 I}{2R} \quad \text{(at center)} \qquad (5)$$

• 
$$R = \text{radius of loop (m)}$$

Direction from RHR-2.

#### Solenoid:

$$B = \mu_0 n I \quad \text{(inside)} \tag{6}$$

- $\bullet$  n = number of turns per unit length
- Field inside is uniform. [Diagram comparing field patterns of loop and solenoid]

# Magnetic Flux

### Magnetic Flux Definition

$$\Phi = BA\cos\theta \tag{7}$$

- B = magnetic field strength (T)
- $A = area (m^2)$
- ullet  $\theta = \text{angle between } \vec{B} \text{ and area normal}$
- Units: T⋅m² or weber (Wb)
- Flux measures the amount of magnetic field passing through an area

[Diagram illustrating magnetic flux through a loop]

# Faraday's Law of Induction

### Faraday's Law

$$emf = -N\frac{\Delta\Phi}{\Delta t} \tag{8}$$

- emf = induced electromotive force (voltage)
- $\bullet$  N = number of turns in coil
- $\Delta\Phi/\Delta t=$  rate of change of magnetic flux
- Minus sign represents Lenz's law
- Electromagnetic induction: process of inducing emf through changing magnetic flux

### Lenz's Law

#### Lenz's Law

The induced emf creates a current that produces a magnetic field that opposes the change in flux that produced it.

- Conservation of energy principle
- Determines direction of induced current
- Represented by minus sign in Faraday's law

[Diagram showing Lenz's law - induced current creating opposing magnetic field]

### Motional Emf

#### Motional Emf Formula

$$emf = Blv \quad (B, I, \text{ and } v \text{ perpendicular})$$
 (9)

- B = magnetic field strength (T)
- I = length of conductor (m)
- v = velocity (m/s)
- Special case of Faraday's law
- Induced when conductor moves through magnetic field

[Diagram of a conductor moving through a magnetic field]

# **Eddy Currents and Magnetic Damping**

- Eddy currents: current loops induced in moving conductors
- Produced when conductors move through non-uniform magnetic fields
- Magnetic damping: drag force created by eddy currents
- Applications:
  - Electromagnetic brakes
  - Metal detectors
  - Induction stoves
  - Damping in moving-coil meters

[Diagram showing eddy currents in a conductor moving through a magnetic field]

### Electric Generators

#### Induced EMF in a Generator

$$\mathsf{emf} = \mathsf{NAB}\omega\,\mathsf{sin}\,\omega\,t$$

(10)

- N = number of turns
- $A = \text{area of coil } (m^2)$
- B = magnetic field strength (T)
- $\omega = \text{angular velocity (rad/s)}$
- Peak emf:  $emf_0 = NAB\omega$
- Converts mechanical energy to electrical energy

[Diagram of a simple AC generator]

### Back EMF in Motors

- Motors are generators running in reverse
- Rotating coil in motor induces its own emf
- Back emf: induced emf that opposes the applied voltage
- Limits current through motor
- Proportional to motor's rotation speed
- ullet Low back emf during startup o high current draw

[Diagram illustrating back emf in a motor]

### **Transformers**

### Transformer Equations

$$\frac{V_s}{V_p} = \frac{N_s}{N_p} \tag{11}$$

$$\frac{l_s}{l_p} = \frac{N_p}{N_s} \tag{12}$$

- Use induction to change voltage levels
- $V_p$ ,  $V_s$  = primary and secondary voltages
- ullet  $N_p$ ,  $N_s=$  primary and secondary turns
- $I_p$ ,  $I_s$  = primary and secondary currents
- Step-up:  $N_s > N_p$ , increases voltage
- Step-down:  $N_s < N_p$ , decreases voltage
- Power is conserved:  $V_p I_p = V_s I_s$

[Diagram of transformer showing primary and secondary coils]

# **Electrical Safety Systems**

### Three-Wire System:

- Live/hot wire
- Neutral wire
- Ground wire
- Grounds appliance case

#### Circuit Breakers/Fuses:

- Interrupt excessive currents
- Prevent thermal hazards

### **GFI (Ground Fault Interrupter):**

- Detects current imbalance
- Protects against shock
- Uses induction principles

#### **Isolation Transformer:**

- Insulates device from source
- Prevents ground loops

### Inductance

#### Self-Inductance

$$emf = -L\frac{\Delta I}{\Delta t}$$
 (13)

- Inductance: property describing how effectively a device induces emf
- L = self-inductance (H, henry)
- $\Delta I/\Delta t$  = rate of current change (A/s)
- $1 H = 1 \Omega \cdot s$
- Self-inductance of a solenoid:  $L = \frac{\mu_0 N^2 A}{I}$
- Energy stored in inductor:  $E_{ind} = \frac{1}{2}LI^2$

### **RL Circuits**

#### Current when turning on:

$$I=I_0(1-e^{-t/\tau})$$

•  $I_0 = \frac{V}{R}$  is final current

Current when turning off:

$$I = I_0 e^{-t/\tau} \tag{15}$$

- Current rises to 0.632*I*<sub>0</sub> in first time constant
- Current falls to 0.368*l*<sub>0</sub> in first time constant

Time constant:  $\tau = \frac{L}{R}$ 

[Graph showing current vs. time for RL circuit turning on and off]

(14)

#### Reactance in AC Circuits

#### Inductive Reactance:

$$X_L = 2\pi f L \tag{16}$$

#### Capacitive Reactance:

 $X_C = \frac{1}{2\pi f C} \tag{17}$ 

- In inductors, voltage leads current by 90°
- Reactance increases with frequency

- In capacitors, voltage lags current by 90°
- Reactance decreases with frequency

[Phasor diagrams showing phase relationships between voltage and current]

### **RLC Series Circuits**

### Impedance in RLC Circuit

$$Z = \sqrt{R^2 + (X_L - X_C)^2}$$
 (18)

- Impedance: AC equivalent of resistance
- Resonant frequency:  $f_0 = \frac{1}{2\pi\sqrt{LC}}$
- At resonance:  $X_L = X_C$  and Z = R
- Phase angle:  $\cos \phi = \frac{R}{Z}$
- Average power:  $P_{ave} = I_{rms} V_{rms} \cos \phi$
- **Power factor**:  $\cos \phi$  (ranges from 0 to 1)

[Graph showing impedance vs. frequency with resonance peak]

# I Do: Force on a Moving Charge

### Example Problem

An electron (charge  $q=-1.6\times 10^{-19}$  C) is moving at  $v=2.0\times 10^7$  m/s perpendicular to a magnetic field of B=0.5 T. Calculate the magnetic force on the electron.

$$F = |q|vB\sin\theta \tag{19}$$

= 
$$(1.6 \times 10^{-19} \text{ C})(2.0 \times 10^7 \text{ m/s})(0.5 \text{ T})(\sin 90)$$
 (20)

$$= (1.6 \times 10^{-19})(2.0 \times 10^{7})(0.5)(1) \tag{21}$$

$$= 1.6 \times 10^{-12} \text{ N} \tag{22}$$

Direction: Use RHR-1, but reverse direction since electron is negatively charged.

# We Do: Circular Motion in Magnetic Field

### Example Problem

A proton (mass  $m=1.67\times 10^{-27}$  kg, charge  $q=1.6\times 10^{-19}$  C) is moving at  $v=3.0\times 10^6$  m/s perpendicular to a magnetic field of B=0.2 T. Calculate the radius of its circular path.

$$r = \frac{mv}{qB} \tag{23}$$

$$= \frac{(1.67 \times 10^{-27} \text{ kg})(3.0 \times 10^6 \text{ m/s})}{(1.6 \times 10^{-19} \text{ C})(0.2 \text{ T})}$$
(24)

$$=? (25)$$

Let's work through this together...

# You Do: Faraday's Law Application

### **Example Problem**

A 200-turn circular coil with area 0.25 m<sup>2</sup> is in a magnetic field that changes from 0.5 T to 0.8 T perpendicular to the coil over a time of 0.1 s. Calculate the magnitude of the induced emf.

$$emf = -N \frac{\Delta \Phi}{\Delta t}$$

$$= -N \frac{\Delta (BA \cos \theta)}{\Delta t}$$
(26)

$$= -N \frac{\Delta(BA\cos\theta)}{\Delta t} \tag{27}$$

$$=? V$$
 (28)

Try solving this problem yourself!

# **Key Equations**

#### **Magnetic Forces:**

# Electromagnetic Induction:

$$F = qvB\sin\theta \qquad (29) \qquad \Phi = BA\cos\theta \qquad (35)$$

$$F = IIB \sin \theta$$
 (30)  $\text{emf} = -N \frac{\Delta \Phi}{\Delta t}$  (36)

$$\tau = NIAB \sin \theta \tag{31}$$

# emf = Blv (motional) (37)

### Magnetic Fields:

#### **AC Circuits:**

$$B = \frac{\mu_0 I}{2\pi r} \text{ (straight wire)} \tag{32}$$

$$(32) X_L = 2\pi fL (38)$$

$$B = \frac{\mu_0 I}{2R} \text{ (loop center)}$$

$$(33) X_C = \frac{1}{2\pi fC}$$

$$B = \mu_0 nI$$
 (solenoid) (34)

$$Z = \sqrt{R^2 + (X_L - X_C)^2}$$
 (40)

(39)

## **Key Concepts**

- Magnetic fields exert forces on moving charges and current-carrying conductors
- The direction of magnetic forces and fields can be determined using right hand rules
- Changing magnetic fields induce emfs (electromagnetic induction)
- Lenz's law: induced effects oppose the change that caused them
- Applications include generators, motors, and transformers
- Inductors oppose changes in current
- In AC circuits, impedance combines resistance and reactance
- At resonance, inductive and capacitive reactances cancel

### Thank You!
